

Memba Market and Competitor Research

What the evidence says

The market gap for **Memba** is real, but it is narrower and more specific than “membership software for any club.” The strongest evidence points to an underserved segment of **volunteer-run outdoor and activity clubs** that need a system for **dues, renewals, households/families, private member information, lightweight communication, and easy admin handoff**, but are poorly served by either heavy all-in-one association systems, creator/community platforms, event tools, or DIY stacks. Existing products usually do one or two parts well, but not the full combination of **volunteer-admin usability + family membership logic + predictable pricing + outdoor-club fit**. ¹

The clearest opening is not at the enterprise end. It is in clubs that are too organized for Google Groups, Mailchimp, Meetup, or Eventbrite, but too price-sensitive or household-heavy for WildApricot or ClubExpress, and too operationally specific for Memberful or Mighty Networks. Public club websites show a fragmented current stack: some clubs use WildApricot or ClubExpress for dues, others use Google Groups and Mailchimp for communications, and public-facing activities often sit on Meetup or Eventbrite. That fragmentation itself is a strong buying signal if Memba can remove admin work rather than add another system. ²

The biggest strategic implication is that **Memba should not try to out-feature every incumbent on day one**. The evidence supports a wedge around **membership operations for volunteer-led outdoor clubs**, with especially strong attention to **households, renewals, privacy-aware directories, simple announcements, exports/Google Sheets sync, and very fast onboarding for the next volunteer who inherits the job**. ³

Competitive landscape

Competitor matrix

Competitor	Current public pricing	Best fit	Strengths for Memba-style use cases	Weaknesses, complaint signal, and gap	Outdoor volunteer club fit	Sources
WildApricot	Starts at \$66/mo for 100 contacts monthly or \$59.40/mo annual prepay; contact-based pricing scales upward.	Small to midsize membership organizations and nonprofits.	Mature all-in-one: membership levels, bundles, directory, partial/full admin permissions, private pages/files, exports, event calendars, waitlists.	Strong public pain signals on contact-based pricing cliffs , laborious contact cleanup, and weak family-event handling; bundle memberships still do not solve per-family-member event selection well.	Medium: proven in clubs, but painful for family-heavy and price-sensitive outdoor groups.	4
ClubExpress	Up to 200 members: 42¢ per primary member/month, 20¢ per secondary member, \$24 minimum hosting fee.	Clubs and associations that want a full club-management suite.	Strong club orientation: member types can include multiple people, secondary-member pricing, directory, events, exports, granular admin/coordinator levels.	Broad capability appears to come with higher complexity and training overhead ; ClubExpress maintains extensive help content, multiple security levels, and recommends staff-assisted loading for all but the smallest clubs.	High for clubs that will tolerate complexity; weaker if volunteer turnover is frequent.	5

Competitor	Current public pricing	Best fit	Strengths for Memba-style use cases	Weaknesses, complaint signal, and gap	Outdoor volunteer club fit	Sources
memberplanet	\$50 / \$100 / \$175 per month plus 2% or 1% platform fee depending on plan and 3% + \$0.30 processing.	Groups, clubs, PTAs, associations needing payments + comms + events.	Unlimited members/ admins on higher tiers, database export to Excel, recurring payments, automatic renewal notices, directory, private member dashboard, strong built-in email and event tooling.	Fee stacking is material; public docs make household/ family support less explicit than membership-level terminology suggests; overall feel is more feature-rich than minimal.	Medium-high if clubs accept fees and broader UI.	6
Join It	\$29 / \$99 / \$199 per month plus 3.0% / 2.0% / 1.5% service fee; nonprofit and annual discounts stack.	Small-to-midsize member organizations wanting a simpler, modern tool.	Strong usability signal; unlimited membership types; member directory; admin permissions; Eventbrite/ Mailchimp/ WordPress integrations; group and couples membership patterns; good customer-support signal.	Service-fee model adds cost as dues volume grows; lighter than classic AMS platforms on rich website/ community features; not deeply trip-specific.	High for the “cleaner alternative to WildApricot/ ClubExpress” segment.	7

Competitor	Current public pricing	Best fit	Strengths for Memba-style use cases	Weaknesses, complaint signal, and gap	Outdoor volunteer club fit	Sources
Memberful	\$49/mo + 4.9% transaction fee.	Creators, publishers, paid newsletters/podcasts, digital memberships.	Excellent for subscriptions, private content, Stripe ownership, newsletters, and group subscriptions.	Product positioning is around content monetization , not club operations; public review summaries mention expensive, missing features , and limited functionality for some users.	Low unless the club mainly sells access to digital content.	8
Raklet	Free tier; Essentials \$49/mo annual or \$59 monthly, Professional \$99/mo annual or \$119 monthly, Premium \$399/mo annual or \$499 monthly ; transaction fees vary by plan.	Membership + community organizations that want more engagement tooling.	All-in-one orientation across memberships, events, directory, community/social features, SMS/email, renewals, donations; role restrictions available on higher plans.	Pricing/transaction fees stack; role-based access and deeper admin controls sit higher in pricing; “corporate membership” is not the same as clean club household logic.	Medium: broader than Memba’s likely MVP, but potentially heavy for volunteers.	9

Competitor	Current public pricing	Best fit	Strengths for Memba-style use cases	Weaknesses, complaint signal, and gap	Outdoor volunteer club fit	Sources
Mighty Networks	Launch \$79/mo, Scale \$179/mo , custom Mighty Pro; transaction fees vary by plan (2% Launch, 1% Scale).	Paid communities, courses, creator-led engagement businesses.	Strong private spaces, profiles, events, engagement, mobile/community experience.	Not built as a membership-admin system for volunteer clubs; household/family logic is weak; payment choice can be limiting, with user complaint signal around "STRIPE or nothing."	Low-medium for clubs that prioritize community experience over operations.	10
WordPress membership stack	Examples: MemberPress plans range from \$199/\$349/\$499 yearly ; Launch plan includes 4.9% transaction fee ; Paid Memberships Pro has Free / \$49 / \$99 monthly plans; WooCommerce Memberships \$199/year .	Orgs that already want to run and maintain a WordPress site.	Maximum flexibility and ownership; can assemble private content, signups, payments, and integrations.	Very high assembly and maintenance burden; public complaints cite weak organizational-membership flexibility and awkward WooCommerce integration; recent active exploit shows real plugin security surface.	Medium for technically strong clubs; low for rotating volunteer admins.	11

Competitor	Current public pricing	Best fit	Strengths for Memba-style use cases	Weaknesses, complaint signal, and gap	Outdoor volunteer club fit	Sources
Google Groups	Free consumer version; org/admin feature set varies with Google account type.	Email-first communities and simple discussion lists.	Free, familiar, roles, collaborative inbox, exportable member lists.	Not a dues or membership system; no recurring billing, renewals, directory, private content management, or meaningful automation; long-standing spam/moderation complaints exist.	Low as a system of record; useful only as one communication component.	12
Mailchimp	Free up to 250 contacts ; Essentials starts at \$13/mo for up to 500 contacts ; Standard starts at \$60/mo for 2,500 contacts ; pricing scales by contact count.	Standalone email marketing and segmentation.	Strong templates, segmentation, automation, role-based access, integrations.	Not membership software; pricing complexity is tied to stored contacts, and official docs say non-subscribed and unsubscribed contacts count toward contact tiers; more powerful features sit on higher tiers.	Low alone; strong as an integration target, not the core system.	13

Competitor	Current public pricing	Best fit	Strengths for Memba-style use cases	Weaknesses, complaint signal, and gap	Outdoor volunteer club fit	Sources
Discourse	Hosted Pro \$100/mo, Business \$500/mo ; subscriptions via plugin.	Discussion-heavy communities that value searchable conversation.	Excellent forums, private/public categories, groups, exports; subscriptions plugin exists; calendar/event capability available via plugin and on higher plan tiers.	Not a full club-membership system; initial setup is a recurring complaint; billing, renewals, households, and club ops need add-ons or external systems.	Low-medium as a communication layer, not as Memba's core competitor.	14
Meetup	Standard from \$29.99/month, \$99.99/6 months, \$174.99/year ; Pro starts at \$55/group/month or \$47/group/month on 6-month billing.	Public group discovery and event-led community building.	Strong local discovery and public event growth; organizer communications; some dues/ticket features.	Weak as a member database and private club admin system; export and advanced comms are Pro-only; official help notes price increases from June 2024, and organizer complaints also include app reliability.	Medium for acquisition/public activities; low for member operations.	15

Competitor	Current public pricing	Best fit	Strengths for Memba-style use cases	Weaknesses, complaint signal, and gap	Outdoor volunteer club fit	Sources
Eventbrite	Free to publish; no fees for free events ; paid-ticket pricing on official organizer page is 3.7% + \$1.79 service fee per ticket plus 2.9% payment processing fee per order .	Event registration, ticketing, waitlists, reporting.	Strong event mechanics: recurring events, attendee emails, custom questions/order forms, reports, waitlists.	No membership lifecycle, renewals, family/household model, or private member operations; public complaint signal consistently centers on high fees and limited branding/control.	Medium for public trips or fundraisers; low for core club membership.	16

Across the landscape, the most important pattern is this: **the closest “job-to-be-done” competitors are WildApricot, ClubExpress, memberplanet, and Join It.** Everything else is either an adjacent layer, a creator/community tool, or a DIY stack. Within that top group, **WildApricot and ClubExpress are the most club-native but heavier; Join It is the cleanest usability benchmark; memberplanet is broad but fee-heavy.** That is the competitive lane Memba should enter. 17

Outdoor club market

The public evidence suggests that outdoor/activity clubs are a **real but fragmented market**. Federations and directories show meaningful club density: the Federation of Mountain Clubs of BC says it has **54 clubs** with **5,000+ members across BC**, Cycling BC maintains a live 2026 list of affiliated clubs/teams/businesses, and BC Marine Trails maintains regional paddling-club directories. That does not give a precise TAM for Memba, but it does show a broad and active club ecosystem in the outdoor categories you named. 18

A practical working view of **club size** from sampled public club pages is: **many local volunteer clubs sit roughly in the tens to low hundreds, while regional legacy clubs can reach several hundred or more.** Examples include Carse Canoe Club at around **40** members, Alki Velo Club at **55+**, EVMA at **200+ paid members**, Woking Cycling Club at **200+**, Hoosier Hikers Council at **270+**, The Rucksack Club at **550+**, and Georgia Appalachian Trail Club at **900+**. National or umbrella organizations go much higher, but those are a different product tier. Based on that sample, Memba’s most plausible initial ICP is something like **30 to 300 members**, with occasional wins above that range. 19

Dues levels vary sharply, but a useful split emerges. For clubs without owned facilities, public dues are often modest: Cleveland Hiking Club lists **\$30/year**, Wanderbirds **\$20/year**, Lambton Outdoor Club **\$25/year**, Nanaimo Paddlers **\$40/year**, Vancouver Velo Vets **\$50/year** plus separate Cycling BC insurance/licensing, Mount Baker Bicycle Club **\$35 individual / \$50 family**, AMC **\$50 individual / \$75 family**, and ADK **\$50 adult / \$70 family**. By contrast, paddling or sailing clubs with equipment, capital contributions, or boathouse access are much higher: Rideau Canoe Club lists **\$360 individual / \$680 family** plus capital contribution and HST, Washington Canoe Club lists **\$950 individual / \$1,300 family**, and UBC Sailing lists **\$397** for non-students. In other words, there are really two sub-markets: a large price-sensitive volunteer-club segment, and a smaller but higher-ARPU facilities/program segment. ²⁰

The market is also clearly **volunteer-administered**. Hoosier Hikers says it is “run exclusively by volunteers,” and UBC Sailing describes itself as a “member-run, not-for-profit club.” Club websites and platform docs also show routine admin tasks such as assigning roles, loading databases, configuring renewal notices, and exporting rosters. This matters because volunteer turnover changes the buying criteria: the winner is often not the system with the longest feature list, but the one the next volunteer can understand in one evening. ²¹

Current tooling is highly fragmented. Rideau Canoe Club and EVMA visibly run on WildApricot; Red Dragon Canoe Club and Lambton Outdoor Club use ClubExpress pages; Potomac Mountain Club explicitly says it uses **Google email groups for member communications and Mailchimp for newsletters**; public hiking communities appear on Meetup; and hiking events are common on Eventbrite. That mix strongly suggests outdoor clubs are not buying an elegant end-to-end platform today—they are assembling one. ²²

These clubs do appear **willing to pay**, but only within tight bounds. They already pay dues, insurance, governing-body fees, software subscriptions, and payment fees. The caveat is that **pricing must feel proportionate to club revenue and volunteer time saved**. Public WildApricot complaints about pricing cliffs and contact cleanup, plus recurring complaints about event fees and tool fragmentation, show that willingness to pay exists, but patience for surprise costs does not. ²³

Pain-point evidence from clubs and users

Evidence	Why it matters for Memba	Source
“run exclusively by volunteers”	Your buyer is often not a professional administrator. Simplicity and handoff matter.	²⁴
“member-run, not-for-profit club”	Same signal from a different club type: volunteer operations are normal, not exceptional.	²⁵
Potomac Mountain Club: “We use a google email group ... and Mailchimp”	Many clubs are already juggling at least two communication tools on top of membership/admin tooling.	²⁶
Google Groups user: “there is no automation in google groups!”	DIY communication stacks break down when a club wants lifecycle automation rather than just a mailing list.	²⁷

Evidence	Why it matters for Memba	Source
WildApricot user: “pricing structure is horrible jumping from a limit of 500 to 2000”	Avoid pricing cliffs tied to contact counts rather than obvious club value.	28
WildApricot user: “I have just had to open 500 contacts individually”	Data hygiene and bulk ops are a real admin pain, especially with volunteer labor.	29
WildApricot family request: “bundle memberships do not have that ability”	Household support is not solved if event/trip registration still works only at the account level.	30
Mighty Networks review: “STRIPE or nothing”	Clubs may care about payment flexibility more than creator/community tools assume.	31
MemberPress review: “Organizational memberships are not as flexible”	WordPress stacks often get brittle when clubs need household/group logic.	32
Discourse review summary: “initial setup can be challenging”	Powerful systems lose on volunteer adoption if setup/admin overhead is too high.	33
Eventbrite review summary: “Fees can add up”	Event-led solutions are expensive if they become the default operating system.	34

Taken together, the pain points are not abstract. They cluster around a short list: **too many tools, too much manual cleanup, awkward household handling, admin complexity, and fee structures that feel misaligned with small-club economics.** That is a coherent product thesis, not just a list of annoyances.

35

Pricing benchmark

The most relevant benchmark for Memba is not “cheapest tool on the internet”; it is **what a club administrator actually compares at renewal time.** Public pricing today places the most relevant competitors roughly in these ranges:

Category	Pricing benchmark	Practical reading for Memba	Sources
Club-native membership suites	WildApricot starts at \$66/mo monthly or \$59.40/mo annual for 100 contacts; ClubExpress is 42¢ per active member/month up to 200 members with a \$24 minimum ; memberplanet starts at \$50/mo plus platform and processing fees; Join It starts at \$29/mo plus service fee, with stacked nonprofit + annual discounts dropping Starter to \$23.49/mo.	This is Memba’s primary comparison set. The market has already normalized paying somewhere between roughly \$24 and \$66+ per month before payment fees for serious membership tooling.	36

Category	Pricing benchmark	Practical reading for Memba	Sources
Creator/ community platforms	Memberful is \$49/mo + 4.9% ; Mighty Networks is \$79/mo Launch or \$179/mo Scale with transaction fees by plan.	These are not perfect substitutes, but they set expectations for modern UX and private-content/community value.	37
DIY WordPress	MemberPress plans range \$199/\$349/\$499 yearly ; PMPro has Free / \$49 / \$99 monthly options; WooCommerce Memberships is \$199/year .	Looks cheap at first, but total cost rises once clubs add hosting, security, forms, event plugins, backups, and volunteer support time.	38
Comms-only tools	Google Groups is effectively free; Mailchimp is free up to 250 contacts , Essentials starts at \$13/mo for 500 contacts , Standard starts at \$60/mo for 2,500 contacts and scales by stored contacts.	These are not full alternatives, but they are the “we can get by with this” fallback.	39
Event-led tools	Meetup Standard starts at \$29.99/mo ; Eventbrite is free to publish but charged on paid tickets at 3.7% + \$1.79 per ticket plus 2.9% per order on the referenced organizer page.	Good for acquisition/public events, but expensive or incomplete as the operating system of a membership club.	40

A useful way to read that benchmark is through club economics. Lambton Outdoor Club charges **\$25/year**. A 100-member club at that dues level grosses about **\$2,500/year** before payment fees. On that basis, WildApricot’s annual 100-contact plan would consume roughly **29%** of gross dues, ClubExpress at 100 active members roughly **20%**, and Join It Starter with combined nonprofit and annual discounts roughly **11%**, all before payment processing. That arithmetic helps explain why clubs are price-sensitive even when they clearly value software. 41

The pricing opportunity for Memba is therefore not “be the absolute cheapest.” It is to be **predictable, explainable, and obviously fair for small clubs**. In this market, **pricing model clarity may matter almost as much as list price**. The evidence especially argues against opaque contact-count cliffs, stacked platform fees, and feature gating that hides essential volunteer-admin functions behind expensive tiers. 42

MVP and positioning recommendations

MVP recommendations

The evidence supports an MVP centered on **membership operations**, but with a few outdoor-club-specific nuances.

The first priority should be a **member and household model**, not just a flat list of people. Outdoor clubs frequently sell **family** pricing and often need to know which specific household members are joining, renewing, or attending activities. WildApricot's long-running family-event pain point is a strong warning that "family membership" is not solved by just putting multiple names under one payer. Memba should treat households and individuals as first-class objects, with per-person participation and permissions inside one billing relationship. 43

The second priority should be a **renewal and payments engine** that is visibly better than today's workarounds: recurring dues, pre-renewal reminders, grace periods, failed-payment handling, offline payment recording, and easy reactivation of lapsed members. This is the single most common operational job the membership suites all emphasize, and it is where communications-only or event-led tools fail. 44

The third priority should be **volunteer-admin ergonomics**: role-based permissions, clean admin handoff, obvious audit trails, bulk actions, clean CSV import/export, and a first-class **Google Sheets export/sync** story. Public complaints about manual cleanup, broad admin complexity, and multi-tool workflows all point here. For this market, "the next volunteer can take over without a training project" is a product feature. 45

The fourth priority should be **private member value** without trying to become a social network: a privacy-aware member directory, private pages/files, simple announcements, and member-only content. That keeps Memba competitive with the baseline expectations set by WildApricot, ClubExpress, memberplanet, and Join It without drifting into the complexity of Mighty or Discourse. 46

The fifth priority is to move **event/trip management** from "later" to "**lightweight soon after launch.**" The evidence does not say Memba must launch with full expedition logistics, waivers, leader management, and route planning. It does say that clubs live through calendars and activities, and that a membership system with no member-only RSVP, waitlist, or activity linkage will feel incomplete quickly. A sensible sequence is: launch with membership ops + directory + announcements, then add **member-only events/trips, RSVP/ waitlist, and activity-specific attendee lists** before attempting a richer trip product. 47

What to **defer** is equally important: full site builder competition with WordPress/WildApricot, broad community feeds like Mighty, deep forum workflows like Discourse, advanced email marketing, and public event discovery. Those are all crowded areas with strong incumbents, and they are not the clearest reason a volunteer hiking or paddling club changes tools. 48

Positioning recommendations

The strongest positioning is **not** "another membership platform." It is:

Memba is the membership platform for volunteer-run outdoor clubs that need simple dues, households, and member operations without the bloat of an association suite or the hacks of a DIY stack. 49

That can be sharpened into four practical positioning messages.

The first is "**built for volunteer admins.**" This directly contrasts with systems whose breadth implies training overhead and with DIY stacks that assume technical ownership. It should be demonstrated with onboarding, migration, templates, and handoff experiences, not just copy. 50

The second is **“households done properly.”** This is one of the clearest under-served problems in the evidence. WildApricot bundles, Join It group/couples memberships, and Memberful group subscriptions all address adjacent needs, but none are clearly optimized for outdoor-club household + activity participation flows. ⁵¹

The third is **“predictable pricing for small clubs.”** Price sensitivity is strong, but it is especially sensitive to pricing models that feel unfair: contact cliffs, layered platform fees, or per-ticket event taxes. Memba should consider pricing around **active members or households**, not all contacts, with household logic included rather than treated as a premium add-on. ⁵²

The fourth is **“works with the spreadsheet reality clubs already have.”** Google Sheets export/sync is not a minor convenience here; it is a trust bridge for volunteer-run groups that already live in Sheets, email, and committee handoffs. A credible migration story from CSV, WildApricot exports, and ClubExpress/member rosters will materially reduce sales friction. ⁵³

Risks, experiments, and limitations

The biggest product risk is that **membership admin alone may not be enough to trigger switching.** Clubs may say they want better renewals, but still make decisions primarily around event/trip workflows because that is where member value is most visible. The right experiment is not a generic interview round; it is a **message test** comparing “households + renewals” against “dues + trips in one place,” followed by a clickable prototype that includes both join/renew and activity RSVP flows. ⁵⁴

The next risk is **price compression.** Small clubs do pay, but they compare software cost to modest dues revenue and often already tolerate ugly workarounds. The best validation experiment is to recruit **pilot clubs in the 30–300 member range** and ask for a **real paid pilot**, not just a design partnership. If clubs love the concept but resist even low-friction annual pricing after seeing the product, that is a signal about market depth. ⁵⁵

A third risk is **migration friction.** Many clubs already have rosters, lapsed members, and mailing habits embedded in old systems. Validation here should be operational: build import templates for at least **CSV, WildApricot exports, and ClubExpress exports**, then measure time-to-live with a real club. If migration takes days instead of hours, volunteer buyers may not switch even if the product is better. ⁵⁶

A fourth risk is **family/household edge cases.** This area is strategically promising precisely because it is messy. The solution is to recruit several clubs that already publish family dues or family membership rules and use them as design partners for the data model before locking the MVP. ⁵⁷

There are also a few limitations in the research. I found strong public evidence on **competitor pricing, positioning, and recurring pain points**, but less uniform public evidence on **family support depth** for every vendor, and no single high-quality public dataset that precisely sizes the North American “volunteer-run outdoor club” software market. The market-overview conclusions therefore rely on a combination of official vendor sources and a sample of public club websites across hiking, mountaineering, cycling, paddling, and related outdoor clubs. Pricing for Mailchimp and some event tools is also localized on official pages, so public list pricing can vary by region or promotional state. ⁵⁸

The highest-confidence conclusion remains the same: **Memba has a credible wedge if it goes narrow**. The most defensible starting point is **membership operations for volunteer-run outdoor clubs**, with standout execution on **households, renewals, admin simplicity, privacy-aware directories, exports/Sheets, and lightweight member communication**, then a near-follow-on into **member-only trip/event workflows**. That is where the evidence most clearly shows incumbent friction and willingness to switch. ⁵⁹
